

PercPlus ON PINE TREES - 2002

Tree Nursery Research

Procedure: Pine seeds were planted at Ashburn Bare Root Nursery with air planter. **PercPlus** at 8 Oz/acre was applied just after planting in sprinkler water. A follow-up foliar application of 32 Oz/acre of **Plant Power** was made 10 days to 2 weeks after emergence. The recommended continued use of **PercPlus**, once per month foliar, was not followed.

Observations and Results: Weather after planting was extremely cold and wet and the control or non-treated bare root seedling plots failed to emerge in the initial planting and had to be replanted some 30 days later. This may account for the of the extreme results gained from the utilization of **PercPlus**. It was determined that the **PercPlus** has real economic benefits.

The **International Forest** Company has continued with the commercial use of **PercPlus** in their nursery programs. The company ownership changed and no further research has been completed.

NOTE: See photos furnished by the **International Forest Company**.
