## Improve Plant Health! Apply *PercPlus* With Your Glyphosate

*DeltAg* Product Brief  
May 10, 2010

For many years, ***PercPlus*** has been applied in a tank-mix with glyphosate to help improve crop vigor. Results have shown improved crop vigor, increased yields and improved weed control. Think about this: ***PercPlus*** is non-selective and improves vigor, not only in your crop, but weeds as well... Healthy weeds are easier to kill!

It is becoming more and more apparent daily that RR crop tolerance to glyphosate is not what it once was. With reports of stressed soybeans following glyphosate and so much new information being published about the long term risks of glyphosate, it is imperative that we work to protect crop health from any undue stress. We must work to keep the crop development on schedule. ***PercPlus*** has been utilized by growers for many years in these types of situations with great success. Take advantage of a product that has been proven to help your crop! Apply ***PercPlus*** with your glyphosate.

**Manganese Deficiency in Soybeans following Glyphosate:** We are all seeing manganese deficiencies in soybeans following glyphosate. We see this on the ends, in low drainage areas and sometimes entire fields. Observations are that when ***PercPlus*** is tank-mixed with glyphosate, there is very little evidence, if at all, of manganese deficiencies in these fields. While we can go back and treat with ***Manganese Plus*** or ***MicroVite*** at 32 Oz/acre and green the crop back up, we are convinced the best approach is to apply ***PercPlus*** with the glyphosate and avoid the problem all together. While we have seen some success when tank-mixing ***Manganese Plus*** with glyphosate, some generic glyphosate formulas have compatibility issues with manganese products. However, we have not verified tank-mix problems with any glyphosate materials with ***PercPlus*** as of this date.

### ***PercPlus*** with Glyphosate: Application Methods and Rates

**Planning One Application of Glyphosate:** Apply ***PercPlus*** one time @ 24 Oz/acre.

**Planning Two Applications of Glyphosate:** Apply ***PercPlus*** in Two applications of 12 to 16 Oz/acre.

\*\*Apply the higher rate when the crop is obviously stressed.\*\*

**After Glyphosate:** When your crop is chlorotic or showing symptoms of stress after glyphosate, ***DeltAg*** recommends the addition of 32 Oz/acre of ***MicroVite*** or ***Manganese Plus*** tank mixed with ***PercPlus***.

**Finally, we are convinced that *PercPlus*, applied with glyphosate, enhances crop health by avoiding these unforeseen stress symptoms and reduces or eliminates delays in crop development.**
